4 Answer Key

sequence increases or decreases by a constant factor called the common ratio. The sequence below is an example of a geometric sequence because each term increases by a constant factor of 6.

11.4: Geometric Sequences - Mathematics LibreTexts

Test for an arithmetic sequence. To test whether a sequence is an arithmetic sequence or not, check if the difference between any two consecutive terms is constant: $\{d = T_2 - T_1 = T_3 - T_2 = \dots = T_n - T_{n-1}\}$ If this is not true, then the sequence is not an arithmetic sequence. Worked example 1: Arithmetic sequence

The explicit formula for the n th term of an arithmetic sequence is $a_n = a_1 + d(n - 1)$. What does each variable in the explicit formula represent? Arithmetic Sequence Lesson 11-2 DRAFT 8th - 9th grade

Arithmetic Sequence Lesson 11-2 | Algebra I Quiz - Quizizz

Read Free Arithmetic Sequence Practice 11

4 Answer Key

In an arithmetic sequence, the difference between a term and its immediately preceding term is always same. Let us see here, $2-1=1$, $4-2=2$, $7-4=3$, $11-7=4$. Here the difference is continuously increasing. Hence, it is not an arithmetic sequence. Note: In a geometric sequence, the ratio of a term to its immediately preceding term is always same.
