Remote sensing in geology is remote sensing used in the geological sciences as a data acquisition method complementary to field observation, because it allows mapping of geological characteristics of regions without physical contact with the areas being explored. About one-fourth of the Earth's total surface area is exposed land where information is ready to be extracted from detailed earth observation via remote sensing. Remote sensing is conducted via detection of electromagnetic radiation by

Remote sensing (geology) - Wikipedia

1.1 Electromagnetic Radiation (EMR) The first and most important component of Remote Sensing is the Energy source to illuminate the Target. The energy is in the form of Electromagnetic Radiation. It is either natural originating from the Sun or earth by emission, or by artificial means.

Geological feature such as fault, folds, dikes can determine by remote sensing technique. Tunneling . A tunnel should not align and excavate along with the fractured stone or adults in the rocks. Remote sensing helps in furnishing all such information and thus ensures the safety of the tunnel during its construction stage.

Geology: Remote sensing can help map large, remote areas. This makes it possible for geologists to classify an area's rock types, study its geomorphology, and track changes caused by natural events such as floods and landslides. Agriculture: Remote sensing is also helpful when studying vegetation. Photographs taken remotely allow biogeographers, ecologists, agriculturalists, and foresters to easily detect what vegetation is present in an area as well as its growth potential and conditions ...

Remote Sensing: Overview, Types, and Applications

Remote Sensing based groundwater prospect zone map serve as a base for further exploration using hydrogeological and geophysical methods to locate well sites. If remote sensing data are used at first level to delineate prospective zones and further follow up by hydrogeological and geophysical surveys, higher success could be achieved besides saving in terms of cost, time and work. Remote Sensing data helps in identifying suitable areas for recharging groundwater.

Applications of remote sensing in geological aspects

Remote sensing refers to obtaining information about objects or areas b y using electromagnetic radiation (light) without being in direct co ntact with the object or area. So, remote sensing is...
