[Material Selection](#) Selecting an elastomeric material is important to the life of a radial shaft seal. The elastomer’s resistance to temperature, abrasion, chemicals, weather, sunlight and ozone can affect a profile’s success in an application. The base polymer must be selected to ensure that these parameters are satisfied without creating...

Although design casting allows for the production of intricately detailed components, the designer should avoid the use of interior undercuts when designing the parts because the moving interior core mechanics are difficult to operate. You can produce this feature by machining, which increases part cost but reduces the tool cost by avoiding ...

It may be defined as a model or form around which sand is packed to give rise to a cavity known as mold cavity in which when molten metal is poured, the result is the cast object. When this mould/cavity is filled with molten metal, molten metal solidifies and produces a casting (product). So the pattern is the replica of the casting.

basic design considerations of the part and the entire casting process. Basic part design: 1. Avoid using sharp corners and angles as they act as stress raisers and may cause cracking and tearing during solidification. Therefore, section changes in castings should be blended smoothly into each other. Design modifications to avoid defects in castings

There are four main metal characteristics that affect the outcome of a casting design: Fluidity is the ease with which various metals flow in a molten state. The more fluid a metal is when liquid, the better it can capture small details within a mold. Shrinkage is the contraction rate of molten metal as it cools from a liquid state.
