Charge Pump Circuit Design (McGraw-Hill Electronic ...

The two common charge-pump voltage converters are the voltage inverter and the voltage doubler circuits. In a voltage inverter, a charge pump capacitor is charged to the input voltage during the first half of the switching cycle. During the second half of the switching cycle the input voltage stored on the charge pump capacitor is inverted and applied to an output capacitor and the load. Thus the output voltage is essentially the negative of the input voltage, and the average input current ...

The charge pump output voltage can now be estimated under varying load conditions. Figure 4 compares the calculated load regulation and measured load regulation as a function of the output current. The discrete charge pump doubler was built using a TPS61087 that switches at 1.2 MHz. VS = 15 V for this design; R1 = 10 Ω , and C1 = C2 = 470 nF. The diodes used in this application are the BAV99,

Discrete Charge Pump Design - Texas Instruments

In open-loop mode, the boost charge pump increases its input voltage by a factor of two and the inverting charge pump multiplies its input voltage by negative one. In burst mode, however, the factors are slightly smaller: V BOOST = 0.94 \times 2 \times V IN_BOOST, and V INV = -0.94 \times V IN_INV.

Charge pumps have been traditionally adopted in nonvolatile memories and SRAMs, in which the design is driven by settling time and low area, or RF antenna switch controllers and LCD drivers, where the main design constraint is the current drivability [9-11]. More recently, CPs are widely used

are used in H bridges in high-side drivers for gate-driving high-side n-channel power MOSFETs and IGBTs. When the centre of a half bridge goes low, the capacitor is charged through a diode, and this charge is used to later drive the gate of the high-side FET a few volts above the source voltage so as to switch it on.

Charge pump - Wikipedia

The proposed charge pump circuit has been simulated using Spectre and in the TSMC 0.18um CMOS process. The simulation results show that the maximum voltage conversion efficiency of the new 3-stage cross-coupled circuit with an input voltage of 1.5V is 99.8%. Moreover, the output ripple voltage has been significantly reduced.

The pump capacitor is initially charged to V_{IN} . When it is connected to C_2 , the charge is redistributed, and the output voltage is $V_{IN}/2$ (assuming $C_1 = C_2$). On the second transfer cycle, the output voltage is pumped to $V_{IN}/2 + V_{IN}/4$. On the third transfer cycle, the output voltage is pumped to $V_{IN}/2 + V_{IN}/4 + V_{IN}/8$.

A common integrated circuit using this principle is the ICL7660, which some consider the prototype of the classic charge pump. The ICL7660 integrates switches and the oscillator so that the switches S_1 , S_3 and S_2 , S_4 work alternately (Figure 1). The configuration shown here inverts the input voltage.
