A water-cooled engine block and cylinder head have interconnected coolant channels running through them. At the top of the cylinder head all the channels converge to a single outlet. A pump, driven by a pulley and belt from the crankshaft, drives hot coolant out of the engine to the radiator, which is a form of heat exchanger. Unwanted heat is passed from the radiator into the air stream, and ...

Engine coolant must be engineered to inhibit corrosion of internal engine passages, and neutralize acids and other byproducts of combustion. And the coolant itself must have an extended service life. Combine all those requirements and you can begin to see that modern engine coolant is a robust but complicated fluid. Prestone, for example, touts ...

Not only is this far too much pressure for the cooling system, the resultant heat could exceed 500 °F, which is far beyond the reading capacity of a cooling system's temperature gauge. Consequently, the coolant will get pushed from the radiator and out onto the ground, and the engine will overheat. Faulty Testing of Subaru 2.5L Models

~~Subaru 2.5L Engines are Known for Cooling Problems~~

coolant must be moved through the engine in some fashion to achieve better heat transfer efficiency and to limit the possibility of overheating the coolant in the hottest parts of the engine. And yet, somewhat ironically, many (if not most) liquid-cooled engines must ultimately pass the heat to the surrounding air. The liquid coolant is used
