Cold stalling problems are the most common because the engine needs a richer fuel mixture to maintain idle speed until it warms up. Intermittent cold stalling problems are almost always fuel-related. On older engines with carburetors, cold stalling (and hard starting) is most often due to an automatic choke that is sticking, misadjusted or broken.

**Solving Intermittent Stalling Problems**

A problem in any component of the car's fuel delivery system can also result in vehicle stalling. For instance, a failing fuel pump will not be able to provide the engine with fuel from the tank. This can lead to a reduction in fuel pressure, resulting in an inconsistent flow of fuel to the engine. At high speeds, this is not a problem.
