Engineering Costs and Cost Estimating. Engineering Costs Go to questions covering topic below. An engineering economic analysis may involve many types of costs. Here is a list of cost types, including definitions and examples. A fixed cost is constant, independent of the output or activity level. The annual cost of property taxes for a production facility is a fixed cost, independent of the production level and number of employees.

Let  $IV_A$  denote the index value at time A and  $IV_B$  denote the current index value for the cost estimate of interest. To estimate the current cost based on the cost at time A, use the equation: Cost at time B = (Cost at time A)  $(IV_B / IV_A)$ . The power-sizing model accounts explicitly for economies of scale.

An alternative method of cost estimation is known as the engineering technique. It simply consists of developing the relation that exists between the inputs and the output (on the basis of the physical production function) and attaching cost values to the inputs in order to obtain a TVC figure for each level of output.

An important point to note is that this screening estimate is based to a large degree on engineering judgment of the soil characteristics, and the range of the actual cost may vary from \$ 1,152,000 to \$ 6,480,000 even though the probabilities of having actual costs at the extremes are not very high.

## **Project Management for Construction: Cost Estimation**

An equipment factored estimate is produced by taking the cost of individual types of process equipment, and multiplying it by an "installation factor" to arrive at the total costs. In practice, this has proven to be quite a useful method since a substantial part of total project costs are made up of equipment.
