This Sixth Edition of Mathematical Structures for Computer Science covers all the topics in the CC2001 suggested curriculum for a one-semester intensive discrete structures course, and virtually everything suggested for a two-semester version of a discrete structures course. Gersting's text binds together what otherwise appears to be a collection of disjointed topics by emphasizing the following themes:

By columns: Column  $j$  of  $AB = A$  times column  $j$  of  $B$ . By rows: row  $i$  of  $A$  multiplies  $B$ . Columns times rows:  $AB =$  sum of (column  $k$ ) (row  $k$ ). All these equivalent definitions come from the rule that  $A B$  times  $x$  equals  $A$  times  $B x$ . Minimal polynomial of  $A$ . The lowest degree polynomial with  $m(A) =$  zero matrix.

Theoretical computer science (TCS) is a subset of general computer science and mathematics that focuses on mathematical aspects of computer science such as lambda calculus or type theory. It is difficult if not near-impossible to circumscribe the theoretical areas precisely. The ACM's Special Interest Group on Algorithms and Computation Theory (SIGACT) provides the following description:

This text explains how to use mathematical models and methods to analyze problems that arise in computer science. The notion of a proof plays a central role in this work. Simply put, a proof is a method of establishing truth. Like beauty, "truth" sometimes depends on the eye of the beholder, and it should not be surprising that what

In computer programming, a string is traditionally a sequence of characters, either as a literal constant or as some kind of variable. The latter may allow its elements

to be mutated and the length changed, or it may be fixed (after creation). A string is generally considered as a data type and is often implemented as an array data structure of bytes (or words) that stores a sequence of ...
