The microwave transmitter and receiver used in these experiments incorporate large horn antennae and wave guides within the body of each to collect the microwaves. Applying boundary conditions to an electromagnetic wave within a wave guide reveals that the wave is an unattenuated standing wave , propagating only along the axis of the guide.

In this experiment, we consider microwaves produced by a transmitter whose axis is vertical. The electric fields of these microwaves are therefore linearly polarized in the vertical plane and travel in the horizontal direction. A receiver which detects such microwaves measures only the component of the incident electric field parallel to its axis.
