NumPy library has some useful functions for finding insights and analyzing the data statistically. We can calculate mean, median, variance, standard deviation, compute histogram over a set of data, and much more. numpy.mean(): with this function, we can calculate the arithmetic mean of a given array where we can also specify the axis.

Cheatsheet for NumPy: Essential and Lesser-Known Functions

NumPy integrates C/C++ and Fortran codes in Python which execute faster as compared to Python. Python list is a heterogeneous collection of elements whereas a NumPy array is a homogeneous collection of elements stored in contiguous memory locations which results in faster access and execution.

Helper functions - NumPy Essentials

In Python we have lists that serve the purpose of arrays, but they are slow to process. NumPy aims to provide an array object that is up to 50x faster than traditional Python lists. The array object in NumPy is called ndarray, it provides a lot of supporting functions that make working with ndarray very easy. Arrays are very frequently used in data science, where speed and resources are very important.
