problems are operations research

problems, hence solving them requires a solid foundation in operations research fundamentals. Additionally, the solution of production systems problems frequently draws on expertise in more than one of the primary areas of operations research, implying that the successful production researcher cannot be one-dimensional.

In operations research, a team of experts from the different fields first define the problem then represent that problem in the

form of a set of mathematical equations. After that, the computer analysis of these mathematical equations is done to find a solution for the problems, and then these solutions are applied to solve managerial and administrative problems.

The British/Europeans refer to "operational research", the Americans to "operations research" - but both are often shortened to just "OR" (which is the term we will use). Another term which is used for this field is "management science" ("MS"). The Americans sometimes

The transportation problem in operational research is concerned with finding the minimum cost of transporting a single

commodity from a given number of sources (e.g. factories) to a given number of destinations (e.g. warehouses). These types of problems can be solved by general network methods, but here we use a specific transportation algorithm. The data of the model include.

From this table, the improved basic

feasible solution is read as: $x_1 = 2, x_2 = 0, s_1 = 2, s_2 = 0$. The improved value of $Z = 6$. Thus the optimal solution is obtained as $x_1 = 3, x_2 = 1, \max z = 11$.
Step 6: Now repeat step 3 through 5 as and when needed until an optimum solution is obtained in table 5. $\theta = \min \{ \theta_j \mid \theta_j > 0 \}$
 $k = \text{Most negative } \theta_j$
 $\theta = 5 \dots$
