QED has been hailed as the most precise scientific theory ever constructed because its predictions have been confirmed by so many experiments throughout the last half of 20th century. It reconciles the many discrepancies between the 'classical' version of electromagnetism and quantum mechanics and successfully explains many other anomalies seen in nature.

That monument of nineteenth-century physics, Maxwell's equations of electromagnetism, formulated light entirely as a wave. Then Einstein came along and explained the photoelectric effect by postulating light as the sum of little packets ("quanta") of energy. Thus were the word "photon" and the quantum theory of light born.

In this theory, a photon is the light carrier with its strange features. The photon travels over all alternative paths from the source to the detector and here it is able to produce an interference pattern when the paths cross each other at an angle. In the graphical illustration all paths are drawn as straight lines.
