Generalizations.

While Koopmans' theorem was originally stated for calculating ionization energies from restricted (closed-shell) Hartree–Fock wavefunctions, the term has since taken on a more general meaning. In the context of density functional theory (DFT), Koopmans' theorem is often used to estimate ionization potentials from the negative of the highest occupied molecular orbital (HOMO) energy. However, this application is only valid for exact exchange functionals and is not generally applicable to hybrid functionals.
