FLUENT computes the heat flux along a wall based on currently selected models to account for the diffusive and radiative energy fluxes (if any). You must only use a DEFINE\_HEAT\_FLUX UDF when you want to employ some other heat transfer mechanism that is not currently being modeled. The total heat flux at the wall will be the sum of the currently computed heat flux (based on the activated models) and the heat flux defined by the UDF.

Non-Equilibrium Model For the second in-house developed model, the Wet-Steam Model built-in ANSYS Fluent is adapted to work with R134a. This model can reproduce non-equilibrium condensation phenomena and its accuracy was tested in a previous work. The method is based on a fully-Eulerian, homogeneous approach.
