Sheaves are essential V-belt drive components. As noted earlier, how well a V-belt fits into the sheave determines how much power the belt drive can transmit and how efficiently it operates. Proper fit is a function of both the belt and the metal sheave. A well-engineered belt and a well-machined, matching sheave provide the optimal combination.

Cross Sections of V-Belt Scope This manual covers V-belt drives used primarily for power transmission in industrial applications. One or more V-belts may be used on a drive, as required, to transmit the horsepower load. In general, the drives are in the integral-horsepower class as distinguished from light duty or fractional horsepower drives.

*Design Manual for Power Transmission Belts*

A V-belt is a power transmission drive distinguishable by its trapezoidal, hexagonal, or triangular cross section shape. Because of their characteristic shapes, V-belts are versatile belts that come in a wide array of standard types, sizes, speed, and are fairly adaptable to practically all types of drive.

A drive belt is a length of synthetic flexible material or rubber, joined to make a loop. Drive belts or V belts are used to join two or more pulleys together. The belts are designed to be fitted to the outer edge of the pulley. When tension is applied to the belt it creates friction, thus transferring friction into motion.

V belts – which also known as Vee belts and wedge belts – are designed to prevent slippage and alignment problems. They take their name from the V-shape of the belt tracks which is what prevents the belt from slipping. With greater load, the belt will also tend to wedge into the groove, hence the alternate name.

Selection of V-Belts The load-transmitting capacities of a single V-belt, at 180° arc of contact, are provided by the belt manufacturer as standard selection data for the user for different areas of belt cross-sections and speed of the faster shaft.

Z, A, B, C, D, E section V belts are measured with an internal length, and the SPZ, SPA, SPB, SPC and the XPZ, XPA, XPB, and XPC section V belts are measured externally including cog section V belts (which are toothed and denoted with an X) and this is clearly demarcated when clicking through the different belt sections but an example of this is below (noting A section is measured internally and SPZ externally).
